DATA SUPPLEMENT
of the INDIANA BUSINESS REVIEW
A REVIEW OF SELECTED BUSINESS INDICATORS

Volume 55, No. 4 May 1980

STRUCTURE OF THE ECONOMY: KEY TO RECESSION RESPONSE

The response of any individual Indiana county to the national recession, now apparently in progress, depends on the structure of business activity in that county. In the following pages the percent of labor and proprietors income originating in each major sector of the economy is detailed for each of Indiana's ninety-two counties.

Labor and proprietors income represents the earnings paid in wages and salaries to labor, employers' contributions to pension plans and other labor income that may not show directly in the pay check. Payments proprietors make to themselves from their business enterprises are also included.

The data presented in this issue relate to 1978 and were released in the past month by the Bureau of Economic Analysis in the U.S. Department of Commerce. These data show the income **generated** in a county; the recipients of that income may be commuting residents from another county. For example, data for Marion County relate to businesses in that county although many of the workers and owners of those businesses reside in the several counties of the metropolitan area. Data for Marshall County only refer to income generated in that county and exclude the income brought in by workers who travel to St. Joseph or Elkhart Counties for their daily employment.

Top income producers

Marion County generated nearly 21 percent of all the labor and proprietors income of Indiana in 1978. Lake County was responsible for 12.4 percent and Allen for 7.0 percent; no other county generated 5 percent of the state's earned income. The top six counties (the three above plus St. Joseph, Vanderburgh, and Elkhart) accounted for 51.7 percent of the state's earned income.

Manufacturing dependence

In Howard County more than 69 percent of the labor and proprietors income originated in manufacturing. Bartholomew County was a close second at 66.4 percent, followed in close order by Fayette and Randolph Counties. In twenty-two counties more than one-half of labor and proprietors income came from manufacturing as shown on the accompanying map. We would expect these counties to have the greatest susceptibility to income and employment fluctuations arising from a national recession. The statewide percentage of income originating in manufacturing in 1978 was 41.9 percent which accounts for Indiana's sensitivity to national business cycles.

Farming dependence

Although argiculture generates a considerable portion of business activity, the actual income for farm owners and workers accounted for only 2.4 percent of the state's labor and proprietors income in 1978. Over 30 percent of the income of Union and Benton Counties originated in farming. In all, sixty-three counties were above the state average of 2.4 percent, with twenty-four counties exceeding 10 percent. These 1978 figures tend to understate farm income because of adverse price cost conditions prevalent during the year.

Other sectors

Contract construction is a highly volatile activity. Many counties show considerable amounts of income from construction because of power plant and other major projects. In 1978 Posey and Jefferson Counties had the highest percent of income originating in contract construction (which excludes most home building). The statewide average from contract construction was 6.0 percent.

Wholesale and retail trade tends to lag manufacturing in its response to recession. Brown County, where tourist activities are of great importance, had nearly 24 percent of its income generated in trade activities. Statewide the figure was 14.7 percent.

MJM
